AWARDS

UTS Dean's List

PROFILE

Penultimate-year Mechatronics Engineering student with hands-on experience in embedded sensing systems, analogue signal processing, and rapid hardware prototyping. Passionate about applying sensor fusion and AI to solve real-world infrastructure challenges. Proven ability to design, build, and iterate on multi-sensor hardware from PCB layout through to software integration — independently and as part of high-performing research teams.

RELEVANT EXPERIENCE

Product Development Engineer

May 2025 – Present

"I did a thing" · YouTube

5.6M+ SUBSCRIBERS

- Sole engineer delivering 10+ functional prototypes for one of YouTube's largest engineering channels — averaging just 30 working hours per complete project cycle (ideation → sourcing → fabrication → iteration).
- Designed and built a wearable flotation device with integrated sail mechanism; produced an autonomous CO₂-actuated projectile system — both requiring rigorous sensor and actuator integration.
- Full engineering autonomy across every stage; all prototypes built to withstand hours of repeated takes during professional filming.

Embedded Systems Engineer

Apr 2024 – Aug 2025

UTS Motorsports Autonomous

- Developed real-time embedded firmware in C for STM32 microcontrollers on an autonomous Formula SAE vehicle, including sensor data acquisition and actuation control.
- Contributed to steer-by-wire system development; showcased technology at SXSW Sydney 2024 to industry professionals, receiving recognition as Rookie of the Year.
- Collaborated within a multidisciplinary team of 30+ across mechanical, electrical, and software subsystems — analogous to the UTS TRU / nbn multi-stakeholder structure.

Casual Academic — Mechatronics Engineering

Feb 2025 – Present

University of Technology Sydney

- Tutored undergraduate cohorts in 41099 Introduction to Mechatronics Engineering, reinforcing concepts in sensor systems, embedded programming, and control theory.

Avionics Trainee

Apr 2024 – Jan 2025

UTS Rocketry Team

- Prototyped avionics data loggers to capture and record in-flight sensor data (accelerometers, altimeters); attended workshops on flight data processing and analysis.

KEY TECHNICAL PROJECTS

Multi-Sensor PCB — Step Tracker & Sensing Platform

HD — Embedded Mechatronics Studio 2025

- Designed a compact multi-sensor PCB in Altium Designer integrating: heart rate monitor, Time-of-Flight distance sensor (secondary daughter-board soldered perpendicularly), OLED display, STM32 microcontroller, USB-C power & communication, and battery charging.
- Implemented a 4th-order Butterworth low-pass filter using only COG/NP0 components for clean analogue accelerometer signal conditioning — directly applicable to non-invasive sensing pipelines.
- Designed for miniaturisation: 0402 SMD components, stencil-applied solder paste, hand-soldered; replaced recommended Arduino shield with integrated STM32 for enhanced performance.

6-DOF Robotic Arm Simulation & Control Software

Distinction — Industrial Robotics 2025

- Developed Python software to simulate and control three 6-DOF robotic arms, implementing forward/inverse kinematics and trajectory planning algorithms relevant to automated inspection pipelines.
